1. Write a program that displays the message "I can!" followed by your name.

2. Design a stopwatch class. Assume that your computer can provide you with sufficiently accurate time. Consider: What is data, what are actions? Discuss, do not write code.

   Note: This is a surprisingly difficult thing to implement properly. The purpose of this exercise is to make you think in terms of objects. Start by defining the minimal setup and develop the ideas incrementally. If you wish, go wild!
