An Invitation to Cryptography:
Classical Ciphers

CMSC 28400, Autumn 2021, Lecture 1

David Cash

University of Chicago

Slides only rarely after today!

I think Cryptography is

Fun and Interesting

Beautiful and unique math
Clever attacks
Philosophy, precisely
The drama!

&

Important

For your daily life
For businesses
For liberty and democracy
Life or death for some

This class: CSMC 28400 “Cryptography”…

… Counts for the theory sequence (BS/BA in CS).
You will work with definitions, theorems, and proofs.

… Is a Computer Science class.
You will write programs building and breaking crypto.

Will assume knowledge in…

Math

Algorithms analysis (Big-Oh)
Discrete probability (a little)
Modular arithmetic

Programming

Write short programs
Understand binary/hex
Learn some python

Not assumed: Computer security
Any crypto knowledge

Outline of Topics

Part 1: Classical Crypto (Week 1)

1. Classical ciphers and how to break them
2. Enigma and the Polish Attack

Part 2: Probability Theory Background (Week 2)

1. Discrete probability spaces and events
2. Random variables

Part 3: Modern Symmetric Crypto (Weeks 3-6)

1. One-time pad and perfect secrecy
2. Blockciphers: DES and/or AES
3. Modes of operation
4. Message authentication
5. Hash functions

Part 4: Public-Key Crypto (Weeks 7-9)

1. Number theory refresh
2. Group theory
3. Discrete logarithms, factoring, RSA problems
4. Public-key encryption
5. Digital signatures

Themes:

1. Attacks!
2. Math AND CS
3. Definitions
4. Proofs

After finishing this class, you should able to…

… Understand design rationale for lots of modern crypto.

… Evaluate the security of many crypto constructions.

… Implement attacks against crypto.

This class won't cover everything, including…

… Lots of relevant crypto. 284 is just a start.

… How to securely implement crypto (!).

… How to design a secure system (website, app, …)

Assessment

1. Problem Sets (1 per week, due Thursdays)
2. Programing Projects (3, spaced during quarter)
3. One midterm exam: Week 6
4. Final exam at end of term

No participation / attendance grade

First problem set and project out this week.

Please read the syllabus (including grading policy) at:
https://www.cs.uchicago.edu/~davidcash/284-autumn-21/

This Lecture: History and Classical Ciphers

1. A very quick history of cryptography
2. Classical ciphers and how they are broken
   - Shift cipher
   - Substitution cipher
   - Vigenère cipher
   - Homophonic cipher
   - One-time pad

Claude Shannon (1916-2001)

Communication Theory of Secrecy Systems*

By C. E. SHANNON

1. INTRODUCTION AND SUMMARY

THE problems of cryptography and secrecy systems furnish an interesting application of communication theory.[1] In this paper a theory of secrecy systems is developed. The approach is on a theoretical level and is intended to complement the treatment found in standard works on cryptography.[2] There, a detailed study is made of the many standard types of codes and ciphers, and of the ways of breaking them. We will be more concerned with the general mathematical structure and properties of secrecy systems.

The treatment is limited in certain ways. First, there are three general types of secrecy system: (1) concealment systems, including such methods as invisible ink, concealing a message in an innocent text, or in a fake covering cryptogram, or other methods in which the existence of the message is concealed from the enemy; (2) privacy systems, for example speech inversion, in which special equipment is required to recover the message; (3) "true" secrecy systems where the meaning of the message is concealed by cipher, code, etc., although its existence is not hidden, and the enemy is assumed to have any special equipment necessary to intercept and record the transmitted signal. We consider only the third type—concealment systems are primarily a psychological problem, and privacy systems a technological one.

Secondly, the treatment is limited to the case of discrete information, where the message to be enciphered consists of a sequence of discrete symbols, each chosen from a finite set. These symbols may be letters in a language, words of a language, amplitude levels of a "quantized" speech or video signal, etc., but the main emphasis and thinking has been concerned with the case of letters.

The paper is divided into three parts. The main results will now be briefly summarized. The first part deals with the basic mathematical structure of secrecy systems. As in communication theory a language is considered to

* The material in this paper appeared originally in a confidential report "A Mathematical Theory of Cryptography" dated Sept. 1, 1945, which has now been declassified.

Probabilistic Encryption*

SHAFI GOLDWASSER AND SILVIO MICALI

Laboratory of Computer Science, Massachusetts Institute of Technology, Cambridge, Massachusetts 02139

Received February 3, 1983; revised November 8, 1983

A new probabilistic model of data encryption is introduced. For this model, under suitable complexity assumptions, it is proved that extracting *any information* about the cleartext from the cyphertext is hard on the average for an adversary with polynomially bounded computational resources. The proof holds for any message space with any probability distribution. The first implementation of this model is presented. The security of this implementation is proved under the intractability assumption of deciding Quadratic Residuosity modulo composite numbers whose factorization is unknown.

Cryptography Today: An International Community

This Lecture: History and Classical Ciphers

1. A very quick history of cryptography
2. **Classical ciphers and how they are broken**
   - Shift cipher
   - Substitution cipher
   - Vigenère cipher
   - Homophonic cipher
   - One-time pad

Why Classical Ciphers?

All of these ciphers are broken. Why study them?

Definition: Cipher

Let **Keys**, **Msgs**, and **Ctxts** be sets. We call a function

$$E : \mathbf{Keys} \times \mathbf{Msgs} \to \mathbf{Ctxts}$$

a *cipher* if for all $K \in \mathbf{Keys}$, $\mathbf{E}(K,\cdot)$ is one-to-one.

We write $\mathbf{E}^{-1}(K,C)$ for inverse (note: not quite function inverse).

Letters as Numbers

Convenient to identify letters with numbers:

A	0
B	1
C	2
D	3
E	4
F	5
…	…
Z	25

Classical Cipher 1: Shift Cipher

Key: Number **K** between 0 and 25

E(K,M) shifts each letter of **M** forward **K** spots, wrapping if needed.

Example: Key=6

a	b	c	d	e	f	g	h	i	j	k	l	m	n	o	p	q	r	s	t	u	v	w	x	y	z
g	h	i	j	k	l	m	n	o	p	q	r	s	t	u	v	w	x	y	z	a	b	c	d	e	f

Breaking the Shift Cipher: Exhaustive Key Search

xihvtiixcvapit
yjiwujjydwbqju
```

Classical Cipher 2: Substitution Cipher

Key: Any permutation **π** of **{A,B,…,Z}**

E(π,M) applies **π** to each letter of **M**

a	b	c	d	e	f	g	h	i	j	k	l	m	n	o	p	q	r	s	t	u	v	w	x	y	z
F	M	S	G	Y	U	J	B	T	P	Z	K	E	W	L	Q	H	V	A	X	R	D	N	C	I	O

E(π,david) = GFDTG

keys = 26! > 2^{88}, i.e. very large

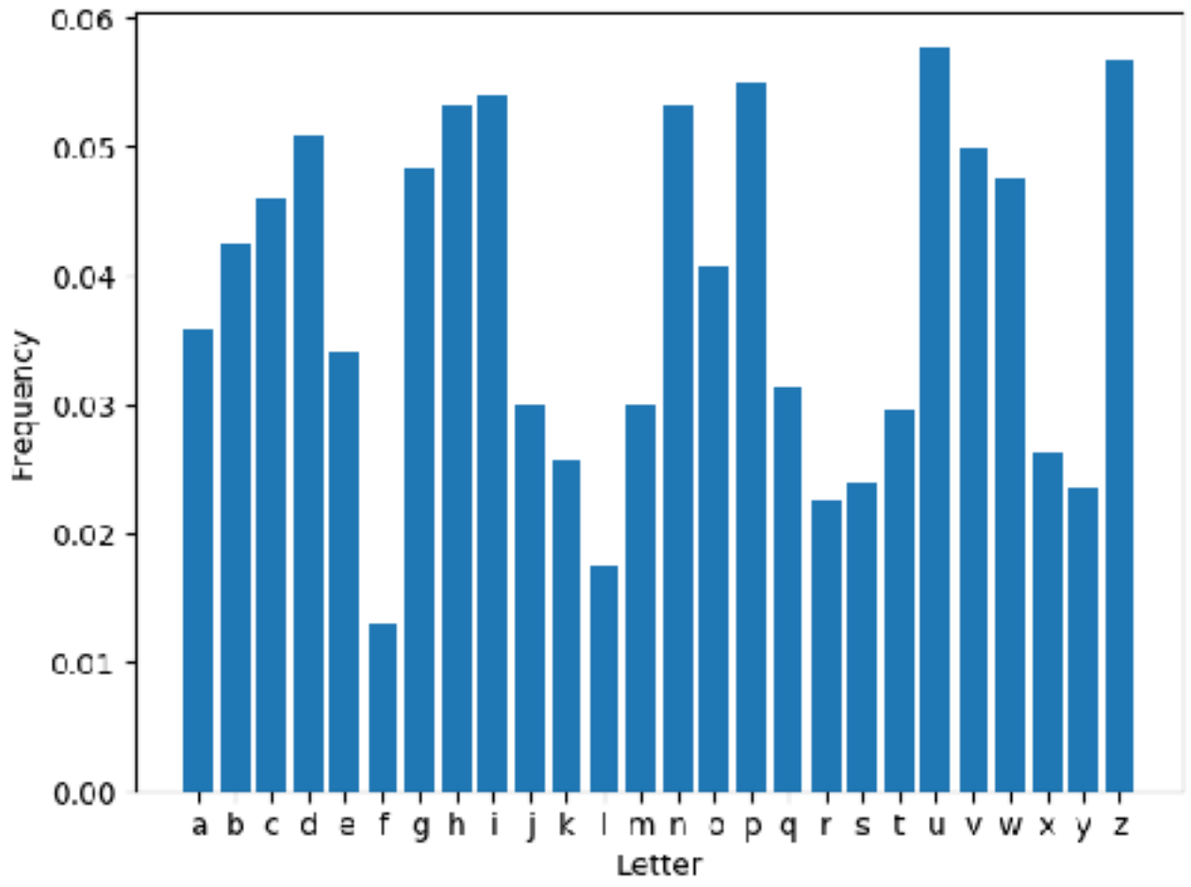
Classical Cipher 3: Vigenère Cipher

Key: Secret word of some length, ex: **CRYPTO**

E(K,M) shifts letters of M using secret word as follows:

```
Key: CRYPTOCRYPTOCRYPTOCRYPTOCRYPTOCRYPTOCRYPTO
Msg: acannercancanasmanycansasacannercancancans
Ctxt: CTYCGSTTYCVOPRQBTBATYCLOURAPGBGIAPGQCEAPGG
```



Finding the Keylength of Vigenère: First Way

```
Key:CRYPTOCRYPTOCRYPTOCRYPTOCRYPTOCRYPTOCRYPTO
Msg:acannercancanasmanycansasacannercancancans
Ctxt:CTYCGSTTYCVOPRQBTBATYCLOURAPGBGIAPGQCEAPGG
```

```
     CTYCGSTTYCVOPRQBTBATYCLOURAPGBGIAPGQCEAPGG
```

Matching chunks start multiples of 6 apart.

Key length probably divides 6, i.e. is 1,2,3 or 6.

Finding the Keylength of Vigenère: Second Way

	#matches
CTYCGSTTYCVOPRQBTBATYCLOURAPGBGIAPGQCEAPGG	
CTYCGSTTYCVOPRQBTBATYCLOURAPGBGIAPGQCEAPGG CTYCGSTTYCVOPRQBTBATYCLOURAPGBGIAPGQCEAPGG	2

CTYCGSTTYCVOPRQBTBATYCLOURAPGBGIAPGQCEAPGG CTYCGSTTYCVOPRQBTBATYCLOURAPGBGIAPGQCEAPGG	2
CTYCGSTTYCVOPRQBTBATYCLOURAPGBGIAPGQCEAPGG CTYCGSTTYCVOPRQBTBATYCLOURAPGBGIAPGQCEAPGG	1
CTYCGSTTYCVOPRQBTBATYCLOURAPGBGIAPGQCEAPGG CTYCGSTTYCVOPRQBTBATYCLOURAPGBGIAPGQCEAPGG	1
CTYCGSTTYCVOPRQBTBATYCLOURAPGBGIAPGQCEAPGG CTYCGSTTYCVOPRQBTBATYCLOURAPGBGIAPGQCEAPGG	9 ←

Classical Cipher 4: Homophonic Substitution Cipher

Key: A table **K** giving possible substitutions for each letter

E(K,M) replaces each letter of **M** with an option from table

a	b	c	d	e	f	g	h	i	j	k	l	m	n	o	p	q	r	s	t	u	v	w	x	y	z
D	0	M	1	A	S	N	U	Q	G	7	T	V	I	6	P	Y	9	E	Z	K	4	X	F	W	L
R				H			B	8					2	C			J	O	5						
3																									

Can use multiple letters/digits per message letter!

Breaking homophonic ciphers: Use bi-gram and tri-gram frequencies. Usually very hard without a lot of text.

Classical Cipher 5: One-Time Pad Cipher

Just Vigenère, under a different usage.

Key: Random letter string *as long as the intended message*

E(K,M) works just like Vigenère

One-Time Pad Cipher: Binary Version

Let x,y be bit strings of length n.

Define x⊕y to be their bit-wise XOR

ex:

	01011	01011	01011
⊕	10010	01011	00000
	11001	00000	01011

Message: Bit string **M**
Key: Random bit string **K** *as long as the intended message*

$E(K,M) = K \oplus M$

$E^{-1}(K,C) = K \oplus C$ ⟵ Same as encryption!

$E^{-1}(K,C) = K \oplus C = K \oplus K \oplus M = 0^n \oplus M = M$

Theorem: (Week 3) The one-time pad cipher is “perfectly secret”.

ASCII/UTF-8 Encoding

Represents printable and non-printable characters as 8-bit bytes

Dec	Bin	Hex	Char	Dec	Bin	Hex	Char	Dec	Bin	Hex	Char	Dec	Bin	Hex	Char

Big No-No: “Reusing” The One-Time Pad

```
Msg1: There is a theory which states …
Msg2: You cant trust code that you …
```

```
Key: af9591e1cbda5f5225b9a0508640846f40876078d0df874…
(hex)
```

```
Ctxt1: 350e5c475c110c42430344155d035 …
Ctxt2: 38094c155a500b16174210134 0154 …
(hex)
```

Observation: C1⊕C2=(K⊕M1)⊕(K⊕M2)=M1⊕M2 (!)

Breaking the "Reused" One-Time Pad: Crib-Dragging

Idea:

1. Guess that some common English fragment (a *crib*) appears at a point in **`Msg1`**.
2. Under this assumption, we get a guess for that part of the key
3. Try decrypting **`Ctxt2`** with partial key guess.
4. If we get intelligible, printable characters, probably correct!

If text follows a format (like html), then try guessing cribs like
 and .

Crib-Dragging Example

```
Msg1: There is a theory which states …
Msg2: You cant trust code that you …

 Key: af9591e1cbda5f5225b9a0508640846f40876
(hex) 078d0df874680ab8316dfe05cea795 …

Ctxt1: 350e5c475c110c42430344155d035 …
Ctxt2: 38094c155a500b16174210134 0154 …
(hex)
```

1. Guess this part decrypts to "**The**"
2. Infer this part of key would be **0xaf9591**
3. Try decrypting this part with **0xaf9591**
4. Discover (ASCII encoding of) "**You**"
5. Conclude correct, move on to other parts

Classical Ciphers: Conclusions

In order to build secure ciphers, we…

1. Need a large number of possible keys
2. Need precise specifications for how they should be used
    - Ex: Only use a one-time pad once!
3. Should assume adversary “knows everyone but the key”
    - Known as “Kerkchoffs’s Principle”

Auguste Kerckhoffs
(1835-1903)

The End
